

Dorian AI - YouTube Automation Stack

This guide walks you through setting up the required tools and services using Docker. Make sure you have [Docker Desktop](#) installed before continuing.

I have made minor changes to the MiniIO installation command. The latest version of MiniIO defaults to "Community Edition", which is super restricted. Now you can use the new docker command and you will get the fully customizable AGPL-v3 License.

Thank you to the people who reported the issue.

Step 1: Install Docker Desktop

1. Download and install Docker Desktop from [here](#).
 2. Follow the installation instructions for your operating system.
 3. Ensure Docker is running before proceeding.
-

Step 2: Run Required Services

Each of the following services will be run as Docker containers.

n8n (Automation Tool)

```
docker run -d --name n8n -p 5678:5678 -e WEBHOOK_URL=http://host.docker.internal:5678  
-e N8N_DEFAULT_BINARY_DATA_MODE=filesystem -v  
C:\Docker\n8n-data:/home/node/.n8n docker.n8n.io/n8nio/n8n
```

If you self-hosting n8n or using it Cloudflare tunnels to host on your domain, use that domain for the WEBHOOK_URL

Minio (Object Storage) — Required before NCA Toolkit

Do not use the latest version.

```
docker run -p 9000:9000 -p 9001:9001 --name minio -v C:\Docker\minio-data:/data -e  
MINIO_ROOT_USER=admin -e MINIO_ROOT_PASSWORD=password123  
quay.io/minio/minio:RELEASE.2025-04-22T22-12-26Z server /data --console-address  
":9001"
```

Access Console:

- URL: <http://localhost:9001>
- Username: `admin`
- Password: `password123`

Next Steps:

1. Log into the MiniIO console.
2. Create a **bucket** named `nca-toolkit`.
3. Generate **Access and Secret Keys**:
 - You can use the default root credentials or create a new user with appropriate permissions.
 - Save these keys; you'll need them for the NCA Toolkit setup.
4. Additional Step: If you are using it on your local device, head to settings and turn the privacy settings and make it public. **DO NOT DO THIS ON SELF HOSTED SETUPS.**

Kokoro TTS (Text-to-Speech)

```
docker run -d --gpus all -p 8880:8880 --name kokoro-tts
ghcr.io/remsky/kokoro-fastapi-gpu:v0.2.2
```

 Requires a compatible NVIDIA GPU and Docker GPU support.

For CPU only version run

```
docker run -p 8880:8880 --name kokoro-tts-cpu
ghcr.io/remsky/kokoro-fastapi-cpu:v0.2.2
```

Step 3: Install NCA Toolkit

Once MiniIO is set up and your access keys are ready:

```
docker run -d -p 8080:8080 --name nca-toolkit -e API_KEY=thekey -e
S3_ENDPOINT_URL=http://host.docker.internal:9000 -e
S3_ACCESS_KEY=your_access_key -e S3_SECRET_KEY=your_secret_key -e
S3_BUCKET_NAME=nca-toolkit -e S3_REGION=None
stephengpope/no-code-architects-toolkit:latest
```

Replace `your_access_key` and `your_secret_key` with the values from MiniIO.

Note that the NCA Toolkit does not have a webUI this is just an API see there github to find out about the end points and what can be done

✅ A Look at All the Services!

Your services should now be running on the following ports:

Service	URL
n8n	http://host.docker.internal:5678
MiniIO	http://host.docker.internal:9001
Kokoro TTS	http://host.docker.internal:8880/web
NCA Toolkit	http://host.docker.internal:8080
